ON THE DIMENSION OF VERTEX LABELING OF k-UNIFORM DCSL OF k-UNIFORM CATERPILLAR

A distance compatible set labeling (dcsl) of a connected graph G is an injective set assignment $f:V(G)\to 2^X$, X being a nonempty ground set, such that the corresponding induced function $f^\oplus:E(G)\to 2^X\setminus\{\varnothing\}$ given by $f^\oplus(uv)=f(u)\oplus f(v)$ satisfies $|f^\oplus(uv)|=k_{(u,v)}^fd_G(u,v)$ for every pair of distinct vertices $u,v\in V(G)$, where $d_G(u,v)$ denotes the path distance between u and v and $k_{(u,v)}^f$ is a constant, not necessarily an integer. A dcsl f of G is k-uniform if all the constant of proportionality with respect to f are equal to k, and if G admits such a dcsl then G is called a k-uniform dcsl graph. The k-uniform dcsl index of a graph G, denoted by $\delta_k(G)$ is the minimum of the cardinalities of X, as X varies over all k-uniform dcsl-sets of G. A inear extension i of a partial order i of i of i in i in i or i in i i

Key words and phrases: k-uniform dcsl index, dimension of a poset, lattice.

INTRODUCTION

Acharya [1] introduced the notion of vertex *set-valuation* as a set-analogue of number valuation. For a graph G = (V, E) and a nonempty set X, Acharya defined a *set-valuation* of G as an injective *set-valued* function $f: V(G) \to 2^X$, and defined a *set-indexer* $f^{\oplus}: E(G) \to 2^X \setminus \{\emptyset\}$ as a *set-valuation* such that the function given by $f^{\oplus}(uv) = f(u) \oplus f(v)$ for every $uv \in E(G)$ is also injective, where 2^X is the set of all subsets of X and $'\oplus'$ is the binary operation of taking the symmetric difference of subsets of X.

Acharya and Germina [2], introduced the particular kind of set-valuation for which a metric, especially the cardinality of the symmetric difference, associated with each pair of vertices is k (where k be a constant) times that of the distance between them in the graph [2]. In other words, determine those graphs G = (V, E) that admit an injective set-valued function $f: V(G) \to 2^X$, where 2^X is the power set of a nonempty set X, such that, for each pair of distinct vertices u and v in G, the cardinality of the symmetric difference $f(u) \oplus f(v)$ is k times
